An Integrated Nonlinear Wind-Waves Model for Offshore Wind Turbines Enzo Marino,2010 This thesis presents a numerical model capable of simulating offshore wind turbines exposed to extreme loading conditions. External condition-based extreme responses are reproduced by coupling a fully nonlinear wave kinematic solver with a hydro-aero-elastic simulator. First, a two-dimensional fully nonlinear wave simulator is developed. The transient nonlinear free surface problem is formulated assuming the potential theory and a high-order boundary element method is implemented to discretize Laplace's equation. For temporal evolution a second-order Taylor series expansion is used. The code, after validation with experimental data, is successfully adopted to simulate overturning plunging breakers which give rise to dangerous impact loads when they break against wind turbine substructures. Emphasis is then placed on the random nature of the waves. Indeed, through a domain decomposition technique a global simulation framework embedding the numerical wave simulator into a more general stochastic environment is developed. The proposed model is meant as a contribution to meet the more and more pressing demand for research in the offshore wind energy sector as it permits taking into account dangerous effects on the structural response so as to increase the global structural safety level.

Application of the Wind Gust Estimate and Comparison to the AFWA MM5 Wind Gust Algorithm Kevin W. LaCroix,2002-03 The Air Force Weather Agency (AFWA) runs the Penn State/NCAR mesoscale Model 5 (MM5) as their main mesoscale weather forecast model. One of the post-processing procedures is a diagnostic algorithm, which is used to help identify convective and non-convective wind gusts. O. Brassuer has identified a new Wind Gust Estimate (WGE), as a physically based method of computing non-convective wind gusts. The WGE surmises that Turbulent Kinetic Energy (TKE) transfers the momentum of faster upper-air winds to the surface, overcoming the buoyant energy of the surface layer. This work converts Brassuer's WGE to FORTRAN code and utilizing post-processed CONUS AFWA MM5 model output to estimate wind gusts by the WGE method. The WGE and AFWA methods are then categorically compared for accuracy and skill in forecasting wind gusts, to determine if the WGE method is superior to the current method. Three geographical regions are identified to determine gust sensitivities of the WGE and AFWA algorithms. The WGE generally performs better than the AFWA algorithm during daylight hours in correctly identifying and predicting gusts. Operational use of the WGE is warranted in the day and coastal regions, while improvements to the algorithm's handling of nighttime wind gusts is needed.

Wind Energy Conversion 1991 British Wind Energy Association. Conference,1991-09-02 Having sited the conference where, even in July, they had a good chance of being able to test theories on a moment's notice, contributors from a wide range of disciplines consider not only the economic and engineering parameters of wind energy, but also the contentious issues of noise, visual impact, and aesthetics that have often accompanied the implementation or attempted implementation of wind farms in economically and politically marginalized regions of Britain. One of the three keynote addresses holds an olive branch to environmentalists. The other 45 papers cover overviews and perspectives, windfarm design and construction, power quality, wind turbine philosophies, autonomous systems, standards, design methods, technical tools, components, planning, visual and aesthetic considerations, noise issues, non-UK markets financing and economics, market and industrial opportunities in the UK, and integrating wind energy into the grid. Proceedings of the XV Conference of the Italian Association for Wind Engineering ,2019 This volume gathers the latest advances, innovations, and applications in the field of wind engineering, as presented by leading international researchers and engineers at the XV Conference of the Italian Association for Wind Engineering (IN-VENTO 2018), held in Naples, Italy on September 9-12, 2018. It covers highly diverse topics, including aeroelasticity, bluff-body aerodynamics, boundary layer wind tunnel testing, computational wind engineering, structural dynamics and reliability, wind-structure interaction, flow-induced vibrations, wind modeling and forecast, wind disaster mitigation, and wind climate assessment. The contributions, which were selected by means of a rigorous international peer-review process, highlight numerous exciting ideas that will spur novel research directions and foster multidisciplinary collaboration among different specialists.

A Mathematical Model of the Structure of Strong Winds D. M. Deaves,R. I. Harris,1978

Improve Energy Production by Using High Efficiency Smart Wind Turbine Blade Jiale Li,2018 Wind energy is considered as one of the most promising green energy sources for its renewable, sustainable, and worldwide availability. Traditional wind farms usually contain hundreds of wind turbines at locations with high quality of wind speed. However, there are more and more distributed wind turbines installed nowadays. Distributed wind turbines are installed at or near the point of end-use for the purposes of meeting on-site energy demand and are sometimes installed at locations with

unfavorable wind quality. Increasing the power efficiency to take advantage of both low and high wind speed is of great importance for the wind energy industry. Optimal designs of the wind turbine blade have been the subject of extensive research, and significant progress has been accomplished in the past years. This study reviewed previous research to lay down a knowledge base for investigating innovative wind turbine blades. Two innovative wind turbine blades, extensible blade and bio-inspired blade are introduced in this study. The extensible 'smart' blade will be extended at low wind speed to harvest more wind energy; on the other hand, it will be retracted to its original shape when the wind speed is above the rated wind speed to protect the blade from damages by high wind loads. An established aerodynamic model is implemented in this paper to evaluate and compare the power output of extensible blades versus a baseline conventional blade. The bio-inspired blade is inspired from the leading-edge tubercles on the humpback whale flippers can improve the hydrodynamic performance of humpback whale. This research investigates the potential of bio-inspired blade technology to improve the performance in increasing wind energy output for the small horizontal axis wind turbine. The high lift low Reynolds number airfoil S1223 was chosen in this research, and the wind tunnel test was conducted in the Control & Energy Systems Center at Case Western Reserve University. The result shows that the blade with a shorter wavelength and larger wavelength of tubercles has better performance in increasing the maximum power coefficient. Additionally, the tubercles can delay the stall significantly comparing to the reference blade. Overall, this research provides insights into the wind resource of different terrain types in Cleveland area and introduces details about two innovative wind turbine blades, which could increase the energy production of the wind turbines.
