*Strong Wind and Vertical Wind Shear Above 30 Km* Arthur J. Kantor, 1969 Strong wind and vertical wind shear must be considered for design and operation of vehicles that will either operate in or penetrate the upper stratosphere and mesosphere. Global extremes of these atmosphere parameters are estimated in this report for altitudes above 30 km. For the Northern Hemisphere estimated 90, 95, and 99% winds, related to the windiest months and locations, are provided for altitudes between 30 and 80 km. Speed increases up to about 55 km and appears to decrease thereafter up to at least 75 or 80 km in November, December, and January. The 99% winds can be expected to approach 215 mps near 55 km at certain locations between latitudes 35 and 60N. For the Southern Hemisphere 90, 95, and 99% winds are provided for altitudes between 30 and 60 km. The 99% winds reach roughly 200 mps near 55 km. Since estimates for the Southern Hemisphere are not necessarily representative of either the windiest month or location, results are uncertain and speeds probably will be somewhat larger than indicated. For the same percentiles, 1-km thick vertical wind shears have been estimated for altitudes between 30 and 70 km. Shears generally increase, and maximum values tend to move equatorward with altitude. *Observed Mean Monthly Winds at Standard Pressure Surfaces from 850 Mb to 100 Mb* Arthur J. Kantor, 1976 This paper contains tables of mean monthly east-west and north-south wind components for January, April, July, and October at 200 Northern Hemisphere locations.

**Wind Patterns Over Lower Lake Mead** United States. Weather Bureau, 1953 It is not the purpose of this report to describe the use of wind observations in the evaporation studies. Rather, the prime objective is publication of the data in a form suitable for microclimatological research.

*Variability of the Monthly Mean Zonal Wind, 30-60 Km* Lloyd V. Mitchell, 1970 This report presents an analysis of the monthly mean zonal wind and the standard deviation of the zonal wind about the monthly mean. The data are presented in

tables and the analyses in time (months)-altitude (30 to 60 kilometers) cross-section as well as profiles for selected levels. The variability of the monthly mean zonal wind, 30 to 60 kilometers, is discussed by individual station. Also, there is a discussion of the altitudinal, latitudinal, monthly, and seasonal variations with a designation of four seasons - winter (dominated by westerlies but with occasional easterlies), November through March; spring transition of westerlies to easterlies, April and May; summer (persistent easterlies), June through August; and fall transition of easterlies to westerlies, September and October.

**Wind-speed Extremes in the Northern Hemisphere, 30 Through 60 Km** Arthur J. Kantor, 1983 This report provides northern hemisphere maps of monthly 90-, 95-, and 99-percentile scalar speeds (10-, 5-, and 1-percent extremes) for altitudes 30 through 60 km. Observed meridional and zonal mean winds and their associated standard deviations were used to derive the magnitude of the mean monthly wind vectors and vector standard deviations. Extreme scalar speeds were then calculated from the magnitudes of the vector means and vector standard deviations, assuming a circular normal distribution. The data used to derive these values consist of wind measurements at and above 30 km from 8 years of data at 12 Meteorological Rocket Network (MRN) stations in the northern hemisphere. Also presented are tables of monthly and annual 10-, 5-, and 1-percent wind-speed extremes at each of the 12 MRN stations.

**Dropsonde Wind Measurements Using Omega/Loran Tracking** James F. Morrissey, Bernard D. Weiss, 1975 In April 1974, a series of aircraft tests was performed to evaluate the usefulness of retransmitted navigational aid signals (NAVAIDS) for measuring winds beneath flight level. Specifically, the OMEGA and LORAN signals were the NAVAID signals investigated. The use of LORAN signals was found to provide better than 1 mps accuracy when 2 min of data were used in the computation. For the OMEGA signals, the accuracy was found to be 1-1/2 mps for a 3-min data interval. In these tests, the 2- and 3-min intervals represent approximately 2000 and 3000 ft intervals of altitude due to motion of sounding instrument.

**Northwest, North Central, and Alaska Wind Atlas** Dean DeHarpporte, 1983 State by state maps of wind speed and wind energy for Washington, Oregon, Idaho, Montana, Wyoming, North and South Dakota, Nebraska, Minnesota, Iowa, northern, south central, southeastern and southwestern Alaska. Based on research done for the U.S. Dept. of Energy by Battelle-Pacific Northwest Laboratory in 1980-81.

An Analysis of Winds Derived from Upwind Rawinsonde Releases Gary J. Thompson, 1972 Rawinsonde balloons were

tracked simultaneously by GMD-1 equipment from the release site and from a site 58 miles downwind. The derived winds are analyzed for three sequential soundings. The results show that the upwind release method (downwind tracking) provides mesoscale winds aloft under conditions prohibitive to conventional tracking methods. Tracking errors for both release methods are analyzed. Large-scale bias errors caused by anomalous propagation appear in the conventional tracking data and produce erroneous wind oscillations which are repeatable in sequential soundings. An analysis of the random error component shows a critical elevation tracking angle of 10 degrees for conventional observations and 9 degrees for the upwind release method. (Author).
